1. Introduction

The Community Survey is the largest survey to be conducted by Stats SA. The survey collected information on population dynamics (population size, composition and distribution; and fertility, mortality and migration), disability and social grants, school attendance and educational attainment, labour force and income.

1.1 Objectives of the release

The main objective of this release is to provide basic results at the municipality level pertaining to:

- The estimated population size; and
- Housing conditions: type of dwelling; tenure status; type of energy used for lighting, cooking and heating; toilet facilities; refuse disposal; and source of water.

1.2 Background

Censuses 1996 and 2001 are the only all-inclusive censuses that Statistics South Africa has thus far conducted under the new democratic dispensation. Demographic and socio-economic data were collected and the results have enabled government and all other users of this information to make informed decisions. When cabinet took a decision to move away from the 5-year to 10-year censuses, that created a gap in information or data between Census 2001 and the next Census scheduled to be carried out in 2011. A decision was therefore taken to carry out the Community Survey in 2007.

The main objectives of the survey were:

- To provide data at lower geographical levels than existing household surveys;
- To build human, management and logistical capacities for Census 2011; and
- To provide inputs into the preparation of the mid-year population projections.

1.2.1 New municipalities and domains of statistical reporting

The dawn of South Africa's new dispensation in 1994 witnessed the establishment of the Municipal Demarcation Board (MDB). In executing their mandate the board created a spatial design that would leave no part of the country outside a jurisdiction of a municipality. This definition of the politico-economic space eliminated the distinction between urban and rural areas which historically were reported on. Statistics South Africa therefore is not in a position to provide population results in terms of urban and rural population.

In establishing the municipalities, the board established three categories of jurisdiction namely, Category A, comprising of six stand-alone metropolitan areas; Category B, comprising of 231 local municipalities and 25 District Management Areas (DMAs); and Category C, comprising of 47 district municipalities. Each district municipality is made up of a group of local municipalities and DMAs

Category A areas: A municipality that has exclusive municipal executive and legislative authority in its area.

Category B areas: A municipality that shares municipal executive and legislative authority in its area with a category C municipality within whose area it falls.

Category C areas: A municipality that has municipal executive and legislative authority in an area that includes more than one municipality.

New municipal boundaries were released in December 2005. The December 2005 municipal boundaries dealt with cross-boundary municipality problems as well as some DMAs. It must be noted that the 2001 municipal boundaries had six district municipalities, eight local municipalities, four DMAs and one metro (Tshwane) straddling provincial boundaries. These were referred to as cross-boundary municipalities. Provincial boundaries were re-determined to realign the above district and local municipalities to a particular province.

This background provides the user with how statistics in South Africa are spatially arranged and reported upon. For more details, see the Constitution of the Republic of South Africa (Act No. 108 of 1996); the Local Government: Municipal Structures Act (Act No. 117 of 1998), and the Organised Local Government Act (Act No. 52 of 1997). Further information can also be found on the web at www.local.gov.za, www.salga.org.za, and www.demarcation.org.za

1.2.2 MDB codes

The codes used by the MDB are constructed as follows:

- Local municipalities – two or three letters to represent the province, followed by a two or three-digit number. However, it is important to note that Limpopo used to be abbreviated as LP but is now abbreviated as LIM, and KwaZulu-Natal used to be KZ but is now abbreviated as KZN.
- District municipalities – the letters DC followed by a one or two-digit number, with no provincial reference.
- District management areas – represented firstly by two or three letters to denote the province, plus the letters DMA, and then followed by a two-digit number.
- Metropolitan municipalities – name only.

The geography metadata for Census 2001, Report No. 03-02-25, and more information on Census 2001 geography can be accessed by users on Statistics South Africa's website (www.statssa.gov.za).

The Community Survey 2007 metadata document contains the geography metadata as applicable to the Community Survey 2007 and it is also posted on the same website.

1.3 How the CS was conducted

The CS 2007 covered 274 348 dwelling units across all the provinces. The sampled dwelling units were visited by fieldworkers who were organised in teams of 5:1 supervisor and 4 field enumerators. The staff were trained by Stats SA personnel on how to administer the questionnaire and the quality assurance procedures that were to be deployed. A total of 238 067 dwellings had completed questionnaires when the fieldwork was completed. The questionnaires were processed using scanning technology to capture the data. A visual check was performed to ensure that the images were clear and that the data was clear and readable.

1.4 Response rates

The survey attained a response rate of 93,9%. This rate takes into account the non-response rates at the EA, dwelling unit and household levels. Two EAs were not covered due to problems encountered with the communities who refused to participate in the survey. Only 238 067 dwelling units out of 274 348 sampled dwelling units had completed a questionnaire. At the household level, the non-response always occurs inside the dwelling unit. It is not easy to deal with the problem without having information to facilitate dual estimation approach such as the Post-enumeration Survey that is carried out for a population census.

The adjustment of non-response is therefore based on the classification of dwelling units/households based on the enumeration status (enumeration completed, partially completed, non-contact, refusal, no usable information, listing error, unoccupied dwelling, demolished dwelling, vacant dwelling and other). In total, 15 393 cases were classified as non-response. The remaining 20 888 cases out of the total sampled dwelling units were invalid or out of scope.

1.5 Outline of the release

- Section 2 presents the estimated population size
- Section 3 presents the results pertaining to housing conditions

1.6 Technical notes

1.6.1 Rounding of data

Community Survey 2007 data were weighted to estimate total households and persons.

Weighting of data leads to the introduction of decimal fractions. These fractions have been rounded to whole numbers. The sum of the separate numbers may therefore differ slightly from the totals given. A similar effect can be seen with the percentages, which are rounded to one decimal place, and therefore might not always total 100.

1.6.2 Imputation

In CS 2007, imputation was used to allocate values for unavailable, unknown, incorrect or inconsistent responses in most categories. The editing system uses a combination of the *logical imputation* and *dynamic imputation* technique.

Logical imputation, in which a consistent value is calculated from other information in the household, is usually preferred over dynamic imputations. Generally, the editing system resolves inconsistencies first by looking at other characteristics of the household (for example, in case of *logical imputation*, a married person with an invalid response for sex would be assigned the opposite sex to their spouse). If this is unsuccessful, then a consistent value is imputed from another person or households of similar characteristics in the data set (*dynamic imputation*).

1.6.3 Definitions

A publication containing all CS 2007 concepts and definitions is available electronically on StatsOnline. Nevertheless, for the convenience of readers, the household is the main term used in this product and is defined as:

Household: A group of persons who live together and provide themselves jointly with food or other essentials for living, or a single person who lives alone.

De facto population: The group of the population who were enumerated according to where they stayed on a specific night

De jure population: The group of the population who were enumerated according to where they usually live.

1.7 Methods used to estimate the population and households at municipal level

1.7.1 Introduction

This section summarises the methods used to estimate the population and households from the Community Survey at municipal level. The user should be aware of the results and the Statistics Council's recommendations regarding the national and provincial estimates released in October 2007 (Report Nos. 03-01-20 and P0301). A cautionary note was included in the aforementioned reports for the users to be aware of the following limitations:

- The population out of the survey scope (i.e. institutions) was considered as an approximation from 2001 Census;
- In the Community Survey, unemployment was measured by using a different set of questions than in the regular Labour Force Survey;
- An unreasonably high income for children, probably due to misinterpretation or no differentiation between parent's income and children's income;
- New trends from the Community Survey with little congruence in numbers of household by province, as compared to the General Household Survey;
- Caution should be maintained when interpreting the grants or numbers of those receiving grants;
- Readers should be aware that the Community Survey does not replace the Census. Hence any interpretation should be understood to have some random fluctuation in data, particularly concerning the small number cells.

The release in October 2007 gave adjusted estimates of the survey at national and provincial levels. These adjustments were done to ensure that the data remained internally and externally consistent at national and provincial level, and by age, population group and sex. The random fluctuation was maintained because the coefficients of variation (CV) were tolerable for national and provincial estimates. However, the same was not true for the municipal domain of estimation as some municipalities showed large CVs. Hence, it became necessary to review the estimates at municipal level in order to remove the systematic biases due to poor realisation of the sample at small-area level.

The statistical count of the Community Survey is measured in terms of number of persons and/or number of households. The universe of the Community Survey covers the persons and households that were sampled within all different enumeration areas as demarcated in the 2001 Census, excluding those classified as institutions and recreational areas.

In order to have new estimates, the past Censuses are considered as the best available sources of data that give information at lower geographical level. Therefore, the new CS estimates are an adjustment to the projected information from these data sets.

1.7.2 The methods of estimation for different municipalities

1.7.2.1 The estimation of the number of persons

The ratio method (Shryock and Siegel 1973) of projecting geographic sub-divisions was used to estimate the populations of the district councils and municipalities in the CS, stratified by population group, sex and single-year-age. The method is agreeable to this purpose and its execution involved four stages as follows:

- Observing the percentage shares of the populations of geographic subdivisions (e.g. District Councils) in the parent population (e.g. province) in one or more past dates. The current exercise made use of the percentage distribution of District Councils in a province (and percentage distribution of municipalities in a District Council) in the 1996 and 2001 censuses, adjusted to the 2006 official boundaries¹;
- Projecting these percentage shares into future dates (the reference date for the CS – mid February 2007 in the current exercise);
- Applying the projected proportions/ percentage shares into independently derived projections of the parent population (in this case the provincial population estimates as published in the October 2007 release of the CS).
- Converting back into numbers of persons (by age, sex and population group) in each district municipality and in each local municipality the estimated proportions.

In view of these projections or estimates, a choice was made for the best estimates based on the comparison between direct CS proportion and the closest estimates in absolute numbers. Any difference greater than 1 000 persons or 10% was subjected to further scrutiny either by checking estimates from recent aerial photographs or administrative registers, or own local municipality survey or estimates. Although these further investigations were limited in nature because of the poor reliability of ancillary sources, the approximation from aerial photographs and independent local estimates results were closer to the projections than direct estimates from CS. If the projection using the ratio method was consistent with the CS, no further change was made. If not, a weighted average was used, as the CS and Census data were not consistent.

Assumptions of the method

Several assumptions could be employed when projecting population percentage distributions of geographic subdivisions. The procedure used in the CS exercise assumes that the average annual rate of change in the proportions observed in the 1996 and 2001 census enumerations, for each area will trend linearly to zero² over a long period (say 60 years).

Limitations of the method

- The method does not explicitly account for other socioeconomic and demographic variables that might be related to the observed proportion by the specified strata.
- The method is not a detailed cohort component projection.

1.7.2.2 Re-calculation of the person weights

The new population estimates by municipalities described above provide additional information about the population that is believed to be more reliable than direct survey estimates. It is therefore possible to get improved precision of the survey estimates in terms of reducing bias and increasing efficiency by applying some form of post-stratification adjustment where the weighted estimated total of the population (age, sex, population group) is constrained to the one coming from the estimated population on national and provincial level.

The calculation of the municipality new adjusted weight for persons by age, sex, and population group in each municipality is given by:

- Dividing the CS design weight by the response rate for each primary sampling unit within each municipality (stratum);
- Multiplying the first adjustment factor based on national and provincial estimates by age, sex, population group; and
- Multiplying the second adjustment factor deduced from the local municipality estimates by age, sex and population group.

¹ To maximise the usage of the data, the percent distributions were observed for both the PES weighted and the un-weighted versions of the censuses. Additionally, weighted averages of the observed percent distributions were calculated (data for census 1996 were assigned a weight of 0,5 because they pertain to a period that is further away from the CS date compared to data from census 2001 which were assigned a weight of 1).

² Note that it is the annual rate of change (not the proportions themselves) that approach zero over time.

1.7.2.3 The estimation of the number of households

The approach separated individuals from households in order to derive more reliable population estimates at a municipal level. After the numbers of people were estimated, revised estimates of the number of households in each municipality were calculated by assuming that the average household size (stratified by majority population group in the household) in each municipality remained unchanged from the data collected in the CS. This ensured that inter-municipal differentials in household composition were preserved. Dividing the new estimate of the number of people in each municipality (stratified by population group) by the average household size (stratified by majority population group of the household) gives a revised estimates (stratified by population group) of the number of households in each municipality.

1.7.2.4 The derivation of CS out-of-scope population

The 2007 Community Survey has not taken into account some elements considered as out of scope of the survey. In order to have as complete an estimate of the population of South Africa as possible, those cases not in scope (such as collective living quarters (institutions) and some households in EAs classified as recreational areas or institutions), needed to be added to the CS estimates. However, as there has not been any recent estimate of these out-of-CS-scope cases, the only possibility was to assume that each individual record falling within the defined categories had remained as counted in the 2001 Census without any change over time.

The above considerations are applied at municipal level in the same way as they have been at provincial level. In order to facilitate data management manipulation, the 2001 Census unit records that covered out-of-CS-scope cases were reduced to easy manageable data points that give the same profile of age, sex, population group and municipality distribution.

1.7.3 Consideration for CS interpretation of results

The users should note that the Community Survey is not a replacement of the Census. An attempt was made to adjust the measurement to a best estimate. Any adjustment done has maintained the profiling of the community in terms of the people and households while compensating and correcting the undercounted bias by different projections on national, provincial and municipalities.

However, the reliability of each of the different estimation methods depends on their internal limitations that lead to some assumptions based on what information is available. Most of the adjustments that were made show that the direct measure by the Community Survey could not produce usable estimates in some municipalities. The exception of better estimates was observed in densely populated municipalities like metros. The less reliable estimates for some small municipalities that were observed in the Community Survey would be part of the sampling methodology review for future surveys. However, the measurement in terms of proportion is much less susceptible to random error than counts (numbers). As a consequence, the Community Survey gives useful information for estimating proportions, averages or ratios for smaller area domains.

Users should be aware of these statements as part of the cautionary notes:

- The household estimates at municipal level differ slightly from the national and provincial estimates in terms of the household variables profile;
- The Community Survey has considered as an add-on an approximation of population in areas not covered by the survey, such as institutions and recreational areas. This approximation of people could not provide the number of those households (i.e. institutions). Thus, there is no household record for those people approximated as living out of CS scope;
- Any cross-tabulation giving small numbers at municipal level should be interpreted with caution such as taking small value in given table's cell as likely over or under estimation of the true population;
- No reliance should be placed on numbers for variables broken down at municipal level (i.e. age, population group etc.). However, the aggregated total number per municipality provides more reliable estimates;
- Usually a zero total figure (excluding those in institutions) reflects the fact that no sample was realised, and in such cases, this is likely to be a significant underestimate of the true population.
- As an extension from the above statement, in a number of instances the number realised in the sample, though not zero, was very small (maybe as low as a single individual) and in some cases had to be reweighted by a very large factor (maximum nearly 800 for housing weight and over 1 000 for person weight).
- As a further consequence, small sub-populations are likely to be heavily over or under-represented at a household level in the data.
- It should be noted that the estimates were done with the use of the de-facto population and not the de-jure population. These results are presented as de-jure population.

The current release focuses on the measurement of households' living conditions at municipal level, as it was done in the national and provincial release. It is hoped that municipalities would be able to gauge their performances in terms of service delivery. The results in this release are issued with proportions of different variables. This is because at lower geographical levels such as municipality, proportions are more reliable than numbers.

2. Population and household profile

Table 2 provides the estimated population and households in Census 2001 and CS 2007. The figures reflect the changes that have occurred since 2001. The number of households in each municipality has been used to calculate the percentages that are presented in the appendices and subsequently utilised to profile the performance of the municipalities in section 3.

3. Housing conditions

Housing is one of the basic human needs that have a profound impact on the health, welfare, social attitudes and economic productivity of the individual. It is also one of the best indicators of a person's standard of living and of his or her place in society. In achieving the Millennium Development Goals, South African Government Policy is to ensure that its citizens live within good housing conditions. In order to achieve this goal, the government wants to eliminate all informal dwellings, bucket type of toilets, and ensure that all citizens have access to electricity for lighting, and access to clean, safe water within a reasonable distance.

This section therefore, highlights the results pertaining to housing conditions. The analysis has been done to profile the performance of the municipalities based on national and provincial achievements.

3.1 Distribution of households by type of main dwelling

3.1.1 Introduction

This part focuses on the percentage of households which reported living in formal and informal dwellings during the CS 2007 at national, provincial and municipal level.

3.1.2 National and provincial profiles

Figure 3.1 gives the percentage of households which reported living in formal (house, flat, semi-detached house, unit in a complex, room in the backyard and not in backyard) and informal dwellings (shack/squatter settlement) in 2007 at provincial level.

The results show that 6 of the 9 provinces recorded higher percentages of households living in formal dwellings as compared to that of South Africa (70,6%): Western Cape (83,4%), Limpopo (83,2%) Northern Cape (80,4%), Mpumalanga (77,0%), Gauteng (73,5%) and Free State (71,0%). North West (66,5%), KwaZulu-Natal (60,5%) and Eastern Cape (54,7%), recorded averages below that of South Africa.

The figure also shows that 3 of the 9 provinces recorded higher percentages of households living in informal dwellings as compared to that of South Africa (14,4%): Free State (18,4%), Gauteng (22,7%) and North West (23,8%). Limpopo recorded the lowest percentage (5,6%) of households living in informal dwellings, followed by Eastern Cape (8%) and KwaZulu-Natal (8,6%).

Figure 3.1: Percentage of households living in formal and informal dwellings, CS 2007

Figure 3.2 shows the percentage distribution of municipalities by percentage of households which reported living in formal dwellings by level of achievement during 2007.

Limpopo and Western Cape had the highest percentage (84,0%) of municipalities having their households living in formal dwellings exceeding the national average of 70,6%, followed by Gauteng (81,8%) and Northern Cape (77,8%). KwaZulu-Natal had the lowest percentage (17,6%). Eastern Cape (46,2%), Free State (55,0%), Mpumalanga (50,0%) and North West (66,7%) are also lagging behind.

North West and Western Cape provinces had the highest percentage (76,2% and 76,0% respectively) of municipalities having households living in formal dwellings more than their provincial average (66,5%). KwaZulu-Natal is trailing behind with only 31,4% of its municipalities exceeding its provincial average of 60,5%, followed by Mpumalanga (38,9%), Gauteng (45,5%) and Northern Cape (48,1%). Two of the provinces (Eastern Cape and Free State) have 50% of their municipalities exceeding their provincial averages.

KwaZulu-Natal recorded the highest percentages of municipalities that had percentages below the national and provincial averages (82,4% and 68,6% respectively). Limpopo and Western Cape had lowest percentage (16,0%) of municipalities below the national average, followed by Gauteng (18,2%) and Northern Cape (22,2%).

Appendix 5.1 shows the following results:

- In Eastern Cape, 18 of the 39 municipalities recorded lower percentages of households living in formal dwellings compared to the provincial average (54,7%). Some of the 18 municipalities, with low percentages are, Umzimvubu (22,2%), Engcobo (22,8%), Mhlonthlo (23,9%), Mbizana (24,7%), Elundini (24,7%), Intsika Yethu (25,6%), Nyandeni (25,6%), Mbhashe (20,3%) , Qaukeni (19,2%), Port St Johns (14,6%), and Ntabankulu (13,7%).
- Nine of the 20 municipalities in Free State, namely, Mohokare (69,7%), Phumelelo (67,8%), Matjhabeng (67,8%), Mafube (67,1%), Nketoane (60,6%), Setsoto (58,5%), Nala (55,9%), Moqhaka (52,2%), and Masilonyana (50,7), had a lower percentage of households living in formal dwellings compared to the provincial average (71%).
- Six of the 11 municipalities in Gauteng, namely, Westonaria (24,7%), Nokeng tsa Taemane (70,6%), Mogale City (69,2%), City of Tshwane (70,8%), Ekurhuleni and Randfontein (71,1%) respectively, had lower percentages than the provincial average (73,5%). Westonaria local municipality had the lowest percentage of households living in formal dwellings as compared to all municipalities in Gauteng.
- On the other hand, in KwaZulu-Natal, 35 of the 51 municipalities had lower percentages than the provincial average (60,5%). Some examples of these 35 municipalities (see appendix 1) with such percentages are, Nongoma (22,5%), Umzimkulu (20,7%), Ingwe (14%), Impendle (13%), Maphumulo (23,1), Nkandla (23,8%) and Msinga (23,9%).
- Twelve of the 25 municipalities in Limpopo, namely Makhuduthamaga (80,8%), Mutale (70,1%), Musina (67,3%), Thabazimbi (51,1%), Greater Giyani (72,2%), Lephalale (75,5%), Modimolle (69,1%), Bela-Bela (74,4%), Elias Motsoaledi (77,6%) , Mookgopong (80,8%), Thulamela (80,4%) and Greater Tubatse (75,8%) had percentages below the provincial average (83,2%).
- Eleven of the municipalities in Mpumalanga are had percentages of households living in formal dwellings below the provincial average of 77%. These were, Msukaligwa (79,6%), Albert Luthuli (70,1%), Mkhondo (68,8%), Seme (76,4%), Lekwa (60,1%), Dipaleseng (52,2%), Govan Mbeki (59,2%), Delmas (67,7%), Emalahleni (61,7%), Steve Tshwete (74,3%), Thaba Chweu (58,0%) and Umjindi (64,6%).

- Five of the 25 municipalities in North West, namely Rustenburg (50,7%), Local Municipality of Madibeng (57,2%), Maquassi Hills (65,2%), Kgetlengrivier (57,7%), and Merafong City (41,3%) had percentages of households living in formal dwellings below the provincial average (66,5%).
- Fourteen of the 27 municipalities in Northern Cape had percentages below the provincial average (80,4%). These municipalities were: Kai!Garib (67,7%), Dikgatlong (67,6%), Kgatelopele (66,4%), Gamagara (65,4%), Moshaweng (65,5%), Magareng (80%), //Khara Hais (79,7%), Tsantsabane (73%), Khai-Ma (74%), Gasegonyana (79,9%), !Kheis (70,4%), Phokwane (76,8%), Kamiesberg (77%), and Richtersveld (78,6%).
- About 6 out 25 municipalities in Western Cape, namely Knysna (66,1%), Bitou (63,4%), George (68,3%), Witzenberg (70,1%), Drakenstein (76,9%) and City of Cape Town Metropolitan (83%), had percentages of households living in formal dwellings below the provincial average (83,4%).

Figure 3.3 shows the percentage distribution of municipalities that had households living in informal dwellings by province in 2007.

Gauteng and North West had the highest percentage of municipalities (81,8% and 76,2%) which reported percentage of households living in informal dwellings above the national average (14,4%), followed by Free State (75,0%). Eastern Cape (5,1%) and KwaZulu-Natal (7,8%) had the lowest percentage of their municipalities exceeding the national average.

Free State (60,0%) and Northern Cape (63,0%) had the highest percentage of municipalities having their households living in informal dwellings more than their provincial averages (18,4% and 10,5% respectively), followed by Gauteng (45,5%) and Mpumalanga (44,4%).

Eastern Cape and KwaZulu-Natal (94,9% and 92,2% respectively) recorded the highest percentage of municipalities of which the percentage of households living in informal dwellings was less than national average (14,4%) followed by Limpopo (88,0%) and Western Cape (80,0%).

KwaZulu-Natal and Western Cape had the highest percentage of municipalities (90,2% and 80,0% respectively) which reported percentages of households living in informal dwellings below their provincial averages (8% and 14,2% respectively) followed by Eastern Cape at 76,9%. Free State (40,0%) and Northern Cape (37,0%) were lagging behind.

Appendix 5.1 shows the following results:

- In Eastern Cape, 9 of the 39 municipalities had percentage of households living in informal dwellings higher than the provincial average of 8%: Buffalo City (24,5%), Maletsuwa (21,8%), Nelson Mandela Bay Metropolitan (13,7%), Kouga (13,1%), Blue Crane Route (11,1%), Mnquma (8,9%), Great Kei (10,1%), Amahlathi (8,3%), and Nxuba (8,8%).
- Eleven of the 20 municipalities in Free State, had higher percentages above the provincial average (18,4%). These municipalities were: Nala (42,1%), Nketoana (31,9%), Setsoto (31,7%), Mohokare (29,2%), Mafube (27,8%), Tswelopele (26,6%), Tokologo (26,3%), Matjhabeng (22,6%), Ngwathe (21,5%), Naledi (19,9%) and Letsemeng (19,5%).

- On the other hand, in Gauteng, Westonaria (41,9%), Mogale City (27%), City of Tshwane (26,8%), Ekurhuleni (26%) and Nokeng tsa Taemane (24,8%) were above the provincial average of 22,7%.
- Only 5 out 51 municipalities in KwaZulu-Natal, namely Mandeni (19,5%), uMngeni (17,7%), eThekweni Metropolitan (17,1%), KwaDukuza (14,7%) and Mbonambi (11,1%), had percentages of households living in informal dwellings that were above the provincial average (8,6%).
- Nine of the 25 municipalities in Limpopo, namely Modimolle (26,5%), Bela-Bela (22,3%), Thabazimbi (17,6%), Musina (13,5%), Polokwane (12,1%), Greater Tubatse (11,3%), Lephalale (10,5%), Mookgopong (9,9%), and Elias Motsoaledi (6,5%) had percentages of households living in informal dwellings that were above the provincial average (5,6%).
- Eight of the municipalities in Mpumalanga had percentages of households living in informal dwellings that were above the provincial average of 11,7%, with Dipaleseng local municipality (43,4%) and Emalahleni (31,2%) having the highest percentages. Other municipalities are: Govan Mbeki (25,7%), Delmas (26,5%), Steve Tshwete (14,7%), Thembisile (12,5%) Thaba Chweu (19,1%) and Umjindi (17,9%),
- Seven of the 25 municipalities in North West, namely Rustenburg (37,3%), Local Municipality of Madibeng (37%), Maquassi Hills (32,6%), Kgetlengrivier (28,8%), Ventersdorp (27,5%), Moses Kotane (25,6%) and Merafong City (24,6%) were trailing behind with percentages of households living in informal dwellings that were above the provincial average (23,8%).
- Seventeen of the 27 municipalities in Northern Cape had percentages above the provincial average (10,5%). Some of these 15 municipalities (see Appendix 1) are: Tsantsabane (25%), Dikgatlong (15,9%), Phokwane (19,5%), Magareng (15,7%), //Khara Hais (15,7%), Siyancuma (15,8%) and Umsombuvu (14,3%).
- About 5 out 25 municipalities in Western Cape, namely Knysna (30,7%), Bitou (27,6%), George (25,3%), Drakenstein (16%) and City of Cape Town Metropolitan (15,6%), had percentages of households living in informal dwellings that were above the provincial average (14,2%).

3.1.3 Summary

Census 2001 and Community Survey (CS) 2007 results, show that nationally there was an increase in the percentage of households living in formal dwellings from 68,5% in 2001 to 70,6% in 2007. On the other hand, the percentage of households living in informal dwellings decreased from 16,4% in 2001 to 14,4% in 2007.

3.2 Distribution of households by tenure status

3.2.1 Introduction

This part presents results on the percentage of households who owned and those who rented their dwellings in 2007.

3.2.2 National and provincial profile

Figure 3.4 gives the percentage of households who owned and those who rented their dwellings in 2007 by province.

The results show that 4 of the 9 provinces recorded lower percentages as compared to the national percentage (61,6%) with regard to the proportion of households who owned their dwellings. These were Free State (59,2%), Gauteng (52,7%), North West (54,1%) and Western Cape (61,1%). Limpopo (76,6%) recorded the highest percentage compared to other provinces. Gauteng (52,7%) had the lowest percentage of households who owned their dwellings.

The figure also shows that Gauteng (26,4%) and Western Cape (23%) recorded higher averages compared to that of South Africa (18,8%) with regard to households who rented their dwellings. Limpopo had the lowest percentage (8,6%) of households who were renting their dwellings, followed by Eastern Cape (11,4%) and Mpumalanga (13,3%).

Figure 3.5 shows the percentage distribution of municipalities (by province) having households who owned their dwellings by province during 2007 (see details in Appendix 5.2).

Limpopo (69.2%) province had the highest percentage of municipalities having their households owning their dwellings exceeding the national average of 61.6%, while Gauteng (8.3%) had the lowest.

Free State (61.9%), North West (57.1%) and Western Cape (56.7%) had the highest percentage of municipalities whose households owned their dwellings exceeding their provincial averages. All other provinces were lagging behind.

Mpumalanga was lagging behind with only 36.8% of its municipalities exceeding its provincial average of 60.4%, followed by Northern Cape (40.6%), Gauteng (41.7%) and Eastern Cape (43.9%).

Five of the provinces had 50% and more of their municipalities exceeding their provincial averages.

Gauteng recorded the highest percentage (91.7%) of municipalities having percentages below the national (56.3%), while Mpumalanga had the highest percentage (63.2%) of municipalities below its provincial average (60.4%).

Limpopo recorded the lowest percentage of municipalities (30.8%) below the national average, while Free State had the lowest proportion of municipalities (38.1%) which reported percentages below its provincial average (56.6%).

Figure 3.5: Percentage distribution of municipalities by level of achievement (comparison to national and provincial averages): Tenure status (owned), CS 2007

Figure 3.6 shows the percentage distribution of municipalities (by province) whose households rented their dwellings during 2007.

Western Cape (76,7%) and Gauteng (75,0%) had the highest percentage of municipalities whose households rented their dwellings above the national average of 18,8%. Limpopo and Eastern Cape recorded the lowest percentages (23,1% and 24,4% respectively).

Mpumalanga (68,4%) had the highest percentage of municipalities whose households rented their dwellings and whose percentages were higher than the provincial average of 14,2%, followed by Eastern Cape (51,2%) and Limpopo (50,0%).

Limpopo (76,9%), Eastern Cape (75,6%), KwaZulu-Natal (72,7%) and Mpumalanga (63,2%) recorded the highest percentages of municipalities whose households rented dwellings and whose percentages were lower than the national average (18,8%). Gauteng (25,0%) and Western Cape (23,3%) recorded lower percentages.

North West (76,2%), Western Cape (73,3%), KwaZulu Natal (67,3%) and Gauteng (66,7%) recorded the highest percentage of municipalities whose percentage of households who rented dwellings were below their provincial averages.

Figure 3.6: Percentage distribution of municipalities by level of achievement (comparison to national and provincial averages): Tenure status (rented), CS2007

3.2.3 Summary

CS 2007 results show that the percentage of households who owned (whether fully paid off or had not yet paid off) their dwellings increased from 56,3% in Census 2001 to 61,6% in 2007. The percentage of households who rented remained more or less the same at 18,7% in 2001 and 18,8% in 2007.

3.3 Use of electricity for lighting, cooking and heating

3.3.1 Introduction

This section highlights the results pertaining to use of electricity, with specific reference to lighting, cooking and heating (Detailed tables are provided in Appendix 5.3).

3.3.2 National and provincial profiles

Nationally there was an increase in the percentage of households that used electricity for lighting (69,7% to 80,0%), electricity for cooking (51,4% to 66,5%) and electricity for heating (49,0% to 58,8%) between Census 2001 and CS 2007.

Figure 3.7 gives the percentages (by province) of households that used electricity for lighting, cooking and heating in 2007.

The results of CS 2007 show that 7 of the 9 provinces recorded a higher proportion of households who used electricity for lighting as compared to the South African average (80,0%). Eastern Cape (65,9%) and KwaZulu-Natal (71,5%) recorded averages below that of South Africa. Gauteng (83,3%), Limpopo (81,2%), Mpumalanga (82,2%), and North West (82,5%) were slightly above the national average, while Free State (86,6%), Northern Cape (86,8%) and Western Cape (93,9%) recorded proportions significantly higher than the national average.

Looking at the proportion of households that used electricity for cooking, 4 of the 9 provinces (Western Cape, Gauteng, Free State and Northern Cape) recorded higher averages than the South African average of 66,5%. Eastern Cape (45,3%), KwaZulu-Natal (61,0%), Limpopo (40,0%) and Mpumalanga (55,6%) recorded averages below the national average. North West (66,1%) was slightly above the national average.

The results of CS 2007 further show that 3 of the 9 provinces recorded a higher proportion of households using electricity for heating as compared to that of South Africa (58,8%) (Gauteng, Northern Cape and Western Cape).

Figure 3.7: Percentage of households using electricity for lighting, cooking and heating

3.3.3 Comparison of municipalities to national and provincial averages

Figure 3.8 shows the percentage distribution of municipalities by province and a comparison to national and provincial averages for the use of electricity for lighting.

Free State, North West and Western Cape had the highest percentages of municipalities whose proportion of households using electricity for lighting exceeds the national average of 80,0%. The majority of municipalities in Gauteng, Limpopo, Mpumalanga and Northern Cape had percentages of households using electricity for lighting exceeding those of the national average. A significant percentage of municipalities in the Eastern Cape (38,5%), Gauteng (54,5%) and KwaZulu-Natal (17,6%) had percentages lower than the national average.

Eastern Cape had the highest percentage (61,5%) of municipalities whose proportion of households using electricity for lighting exceeded the provincial average. Some of these municipalities in the Eastern Cape were Amahlathi (67,4%), Camdeboo (98,1%), Inxuba Yethemba 94,1%, and Senqu (78,7%).

In Free State, Limpopo, Northern Cape and Western Cape the percentage of municipalities who were higher and lower than the provincial average was roughly the same. Some of those exceeding the provincial average in the Free State were Kopanong (91,6%), Mantsopa (88,9%), Moqhaka (94,7%) and Setsoto (88,6%). In Northern Cape Gamagara (97,4%), Khai-Ma (92,9%) and Siyancuma (88,9%) were among those that exceeded the provincial average, whereas in Western Cape examples were Beaufort West (95,2%), Hessequa (96,2%), Mossel Bay (95,3%), and Swartland (97,0%).

A significant proportion of municipalities in Gauteng (63,6%), Mpumalanga (61,1%), North West (59,3%) and KwaZulu-Natal (68,6%), had proportions of households using electricity for lighting lower than the provincial average. Those in Gauteng that were still exceeding the provincial average were the City of Johannesburg (89,4%), Emfuleni (93,5%), Midvaal (89,9%), and Mogale City ((85,5%). In Mpumalanga they were Bushbuckridge (90,1%), Dr JS Moroka (95,7%), Emakhazeni (89,2%), Govan Mbeki (87,5%), Mbombela (85,2%), Steve Tshwete (90,4%) and Thembisile ((95,9%). Examples in North West were the City of Matlosana (85,1%), Mafikeng (83,9%), Naledi (85,3%) and Ramotshere Molioa (84,0%). In KwaZulu-Natal Endumeni (80,7%), Hibiscus Coast (91,1%), Newcastle (81,5%) and uMngeni (71,6%) were examples.

Figure 3.8: Percentage distribution of municipalities by level of achievement (comparison to national and provincial averages) - Electricity for lighting, CS 2007

Figure 3.9 shows the percentage distribution of municipalities by province and a comparison between national and provincial averages for the use of electricity for cooking. Free State, Gauteng, North West and Western Cape had the highest percentages of municipalities of which the proportion of households using electricity for cooking exceeded the national average of 66,5%. A significant proportion of municipalities in Eastern Cape (69,2%), KwaZulu-Natal (82,4%), Limpopo (88,0%), Mpumalanga (72,2%), and Northern Cape (66,7%) had proportions using electricity for cooking that were lower than the national average.

Both North West and Mpumalanga had the highest percentage (55,6% each) of municipalities of which the proportion of households using electricity for cooking was higher than the provincial average. Some of these municipalities in North West were the City of Matlosana (71,8%), Lekwa-Teemane (75,4%), Merafong City (72,2%) and Potchefstroom (83,0%). In Mpumalanga examples were Govan Mbeki (71,7%), Lekwa (67,0%), Mbombela (73,6%) and Steve Tshwete (77,0%),

In Eastern Cape, Limpopo and Western Cape the proportions of municipalities who exceeded the provincial average, and those that were below the provincial average, were roughly the same. Some of those exceeding the provincial average in the Eastern Cape were Baviaans (66,0%), Kou-Kamma (70,1%), Ngquushwa (51,4%) and Sunday's River (72,0%). In Limpopo those that had averages higher than the provincial average were Aganang (43,0%), Ba-Phalaborwa (60,0%), Bela-Bela (62,0%), Greater Tubatse (41,0%), Lepele-Nkumpi (54,0%), Lephalale (47,0%), Modimolle (67,0%), Mogalakwena (48,0%), Molemole (52,0%), Mookgopong (61,0%), Musina (67,0%), Polokwane (62,0%), and Thabazimbi (68,0%), whereas in the Western Cape they were Breede River/Winelands (94,8%), Breede Valley (93,5%), Cederberg (94,7%), City of Cape Town Metropolitan Municipality (89,5%), Hessequa (90,9%), Matzikama (89,7%), Overstrand (89,7%), Saldanha Bay (96,4%), Stellenbosch (97,5%), Swartland (93,7%) and Swellendam (93,1%).

In Free State (60,0%), Gauteng (63,6%), KwaZulu-Natal (80,4%) and Northern Cape (66,7%), a significant proportion of the municipalities had percentage of households using electricity for cooking lower than the provincial average. Some of those municipalities in the Free State whose percentages were still higher than the provincial average were Mangaung (80,2%), Matjhabeng (77,0%) and Moqhaka (88,4%). In Gauteng they were the City of Johannesburg (88,2%), Emfuleni (92,2%), Midvaal (85,7%) and Mogale City (82,0%). Examples in KwaZulu-Natal were Endumeni (71,6%), eThekweni Metropolitan Municipality (82,7%), Mandeni (72,6%) and uMhlathuze (84,9%). Examples in Northern Cape were //Khara Hais (87,7%), Kai !Garib (82,6%), Khai-Ma (83,8%) and Ubuntu (83,3%).

Figure 3.9: Percentage distribution of municipalities by level of achievement (comparison to national and provincial averages) - Electricity for cooking, CS 2007

Figure 3.10 shows the percentage distribution of municipalities by province and a comparison between national and provincial averages for the use of electricity for heating. Gauteng, North West and Western Cape had the highest percentages of municipalities whose proportion of households using electricity for heating exceeded the national average of 58.8%.

A significant proportion of municipalities in Limpopo (60,0%) and North West (55,6%) had percentages of households using electricity for heating exceeding the provincial average. The municipalities in Limpopo were Ba-Phalaborwa (60,0%), Bela-Bela (62,0%), Greater Tubatse (41,0%), Greater Tzaneen (39,0%), Lepele-Nkumpi (49,0%), Lephalale (38,0%), Makhuduthamaga (39,0%), Modimolle (57,0%), Mogalakwena (45,0%), Molemole (51,0%), Mookgopong (53,0%), Musina (52,0%), Polokwane (58,0%) and Thabazimbi (57,0%).

Some of those in North West were City of Matlosana (69,1%), Moretele Local Municipality (62,7%), Naledi Local Municipality (60,6%), Potchefstroom (77,3%) and Rustenburg (68,9%).

In Western Cape the proportion of municipalities whose percentages were either higher or lower than the provincial averages were roughly the same. Some of those exceeding the provincial average in Western Cape were Bergvlier (96,1%), Cederberg (87,1%), Oudtshoorn (83,0%) and Saldanha Bay (96,7%).

A significant proportion of municipalities in Eastern Cape (64,1%), Free State (75,0%), Gauteng (72,7%), KwaZulu-Natal (80,4%) and Northern Cape (66,7%) had higher percentages of households using electricity for heating that were below the provincial average. In Eastern Cape examples of municipalities that still recorded proportions higher than the provincial average were Buffalo City (46,6%), Kouga (84,7%), Ndlambe (67,2%) and Nelson Mandela Bay Metropolitan Municipality (74,9%). Those in Free State that were higher than the provincial average were Mangaung (57,7%), Matjhabeng (63,1%), Metsimaholo (69,0%), Moqhaka (70,9%) and Ngwathe (78,9%). In Gauteng they were the City of Johannesburg (84,7%), Emfuleni (87,2%) and Midvaal (78,9%).

Examples in KwaZulu-Natal were Endumeni (64,8%), eThekweni Metropolitan Municipality (80,8%), Hibiscus Coast (73,0%), KwaDukuza (80,1%), Mandeni (73,5%), Mtubatuba (70,2%), Newcastle (59,3%), Msunduzi (84,5%), uMhlathuze (82,3%) and uMngeni (58,4%). In Mpumalanga examples were Govan Mbeki (58,2%), Mbombela (61,8%) and Steve Tshwete (64,5%). In Northern Cape examples were Emthanjeni (74,5%), Hantam (74,2%), Kareeberg (65,8%) and Nama Khoi (95,3%).

Figure 3.10: Percentage distribution of municipalities by level of achievement (comparison to national and provincial averages) - Electricity for heating, CS 2007

3.3.4 Summary

In South Africa as a whole, 54,0% of the municipalities had higher proportions of their households using electricity for lighting than the national average. In 18 municipalities, 95% or more of households used electricity for lighting, whilst 3 municipalities had less than 20% of their households using electricity as an energy source for lighting.

With regard to using electricity for cooking, 39,2% of the municipalities in the country as a whole had higher proportions of their households using electricity for cooking than the national average. In 4 municipalities 95% or more of the households used electricity for cooking, whilst 17 municipalities had less than 20% of their households using electricity as an energy source for cooking.

34,2% of the municipalities in South Africa had higher proportions of their households using electricity for heating than the national average. In 3 municipalities, 95% or more of their households used electricity for heating, whilst 34 municipalities had less than 20% of their households using electricity as an energy source for heating.

3.4 Toilet Facilities

3.4.1 Introduction

The purpose of this section is to highlight the prevalence of the use of pit latrines, the bucket system, and also no toilet facilities by households in the municipalities in each province.

3.4.2 Distribution of households by main type of toilet facility

Figure 3.11 shows the percentage of households that used pit latrines as type of toilet facility in each province in 2001 and 2007. The figures show that the percentage of households which used pit latrines increased since 2001 in Eastern Cape (27,4% in 2001 to 29,3% in 2007) and Limpopo (58,4% in 2001 to 64,5% in 2007).

Figure 3.11: Percentage of households using pit latrines by province - Census 2001 and CS 2007

Figure 3.12 shows the percentage of households which used the bucket system as a toilet facility in each province in 2001 and 2007. It shows that the percentage of households using the bucket system declined in all the provinces. Free State had the highest percentage (12,7%) of households still using this system.

Figure 3.12: Percentage of households using bucket toilets by province - Census 2001 and CS 2007

Figure 3.13 gives the percentage of households that had no form of toilet facility in each province in 2001 and 2007. The figures indicate that the percentage of households that had no toilet facility declined in all the provinces. However, Eastern Cape showed the highest proportion of households (23,5%) that had no toilet facility

Figure 3.13: Percentage of households with no toilet facilities - Census 2001 and CS 2007

Figure 3.14 shows the percentage distribution of municipalities in all provinces having households using pit latrine facilities during 2007 compared to the national and provincial averages. Eastern Cape (48,7%), KwaZulu-Natal (66,7%), Limpopo (52,0%) and Western Cape (60,0%) recorded percentages of municipalities with households using pit latrines higher than their own provincial averages of 29,3%, 33,5%, 64,5%, and 0,8% respectively as shown in Appendix 5,4.

Figure 3.15 shows the percentage distribution of municipalities having households using bucket toilets during 2007. All the provinces except Free State recorded a significant percentage of municipalities with households using bucket toilets below the national average of 2,2%..

Figure 3.16 shows the percentage distribution of municipalities having households with no toilet facilities during 2007. All the provinces recorded higher percentage of municipalities with households having no toilets above the national average of 8,2%.

For example in Limpopo, 9 of the 25 municipalities had percentages of households without toilet facilities higher than that of the province. These include: Greater Giyani (40,7%), Greater Letaba (18,6%), Greater Tzaneen (15,2%), Ba-Phalaborwa (19,6%), Maruleng (20,0%), Musina (12,6%), Mutale (29,4%), Thulamela (17,5%), and Boluberger Local Municipalities (21,4%).

3.4.3 Summary

Pit latrines are most common in Limpopo (64,5%) and least common in Western Cape (0,8%). Bucket toilets are mostly used in Free State (12,7%), Northern Cape (4,4%), and North West (4,2%). These have proportions above the national average of 2,2%. Eastern Cape and Western Cape percentages were slightly above the national average.

For no toilets, on the other hand, Eastern Cape, Free State and KwaZulu-Natal recorded more than half of their municipalities having households above the national average that had no toilet facility.

3.5 Refuse removal

3.5.1 Introduction

The purpose of this section is to highlight the availability of refuse removal services in municipalities, whether it is removed by local authority or a private company.

3.5.2 Distribution of households by refuse removal

The results presented in Figure 3.17 show that nationally, there was an increase in the percentage of households whose refuse was removed by local authority or private company (from 57,0 % in 2001 to 61,6% in 2007). The percentage of households with no refuse removal decreased from 8,7% in 2001 to 7,1% in 2007.

Figure 3.17: Percentage of households by type of refuse removal, Census 2001 and CS 2007

Figure 3.18 gives the percentage of households whose refuse was removed by local authorities or private company and those that had no refuse removal facilities in 2007 by province.

The results show that 4 out of the 9 provinces recorded a higher percentage of households who had their refuse removed by local authorities or private companies as compared to that of South Africa (61,6%): Free State (76,0%), Gauteng (86,1%), Northern Cape (72,2%) and Western Cape (91,0%).

In 2007, Eastern Cape (40,0%), KwaZulu-Natal (51,9%), Limpopo (18,0%), Mpumalanga (41,5%) and North West (54,8%) recorded percentages below that of South Africa. The figures also show that Limpopo had the lowest percentage of households whose refuse was removed by local authority or private company (18,0%). Eastern Cape and Limpopo had the highest proportion of households without refuse removal facilities (both at 14,0%), a figure above the national average of 7,1%, while Western Cape had the lowest at 1,0%.

Figure 3.18: Percentage of households by refuse removal and province, CS 2007

Figure 3.19 shows the percentage distribution of municipalities having households whose refuse is removed by local authority or private company in 2007 by province. During 2007, Free State (80,0%), Gauteng (81,8%), Northern Cape (77,8%) and Western Cape (96,0%) had the highest percentage of municipalities with households whose refuse was removed by local authority or private company exceeding the national average of 61,6% while Limpopo (8,0%) and KwaZulu-Natal (11,8%) had the lowest percentages (see Appendix 5,5).

Figure 3.20 shows the percentage distribution of municipalities in provinces having households without refuse removal facilities. All the provinces with the exception of Western Cape, had a percentage of municipalities with households without refuse removal facilities exceeding the national average of 7,1%.

3.5.3 Summary

Free State, Gauteng, Northern Cape and Western Cape recorded more than 50% of their municipalities with households having their refuse removed by local authority or private company above the national average.

KwaZulu-Natal and Limpopo, Mpumalanga and North West recorded over 50% of their municipalities having less than national average of households whose refuse is removed by local authority or private company.

On the other hand, a significant percentage of municipalities in Gauteng, KwaZulu-Natal, Limpopo and North West recorded percentage of households having their refuse removed by local authority or private company below the provincial averages.

Eastern Cape, KwaZulu-Natal and Limpopo recorded more than 50% of their municipalities with no refuse disposal facilities above the national average.

Two provinces, namely Gauteng and KwaZulu-Natal had more than 50% of municipalities that recorded having no refuse disposal above the provincial average.

3.6 Access to water

3.6.1 Introduction

This section highlights results pertaining to access to piped water by households. In general, increased access to piped water results in improved health outcomes in the form of reduced cases of water-borne diseases – hence a healthy population.

3.6.2 Percentage of households with access to piped water

Figure 3.21 shows the percentage of households which had access to piped water in 2001 and 2007 at provincial level. The results indicate an increase in the percentage of households which had access to piped water throughout the provinces since 2001. There are, however, variations across the provinces with Western Cape leading with 98,8% of households having access to piped water. Gauteng follows with 97,9% and the Free State with 97,3%. On the other hand, provinces that had the least accessibility to piped water are Eastern Cape at 70,8% and KwaZulu-Natal at 79,29%. Other provinces vary between 80,0% and 95,0%.

Figure 3.22 provides results related to the percentage of households that had access to piped water within 200 metres by province in the year 2001 and 2007. The national average of the proportion of households that had access to piped water within 200 metres was 72,1% in 2001 and 74,4% in 2007. A variation was noticed across the provinces where Western Cape was notable with 9 in 10 households having access to piped water within 200 metres. This is preceded by Free State with almost the same proportion of 9 in 10 households, and Gauteng at 88,4%. Provinces that had percentages below the national estimate were Eastern Cape (54,1%), Limpopo (56,3%) and KwaZulu-Natal (63,3%).

Figure 3.22: Percentage of households with access to piped water within 200 metres by province

3.6.3 Performance of municipalities across provinces

Figure 3.23 profiles the achievement of municipalities measured against national and provincial achievements. When looking at the provinces with more than ten municipalities which had proportions accessing piped water less than the provincial average, we notice that Western Cape had 20 municipalities, Eastern Cape had 14 municipalities, Northern Cape had 13 municipalities, Free State had 14 municipalities and KwaZulu-Natal had 37 municipalities as shown in Appendix 5.6.

However, the following municipalities in North West did not meet the provincial average: Mafikeng at 67,77%), Kagisano at 76,49%, Molopo at 81,04%, Ratlou at 85,77%, Rustenburg at 86,64%, Madibeng at 87,63%, Moretele at 87,99%, Tswaing at 88,83%, Kgetlengrivier at 89,41% and Ramotshere Moiloa at 89,53%.

The following municipalities in Gauteng did not meet the provincial average: West Rand at 66,7%, Kungwini at 86,2%, Nokeng tsa Taemane at 87,2%, Midvaal at 94,0%, Randfontein at 94,3%, Lesedi at 95,9%, Mogale City at 96,8% and the City of Tshwane at 97,2%.

In Mpumalanga the following municipalities did not meet the provincial average: Dr JS Moroka at 70,9%, Mkhondo at 79,9%, Albert Luthuli at 84,2%, Bushbuckridge at 87,0%, Nkomazi at 90,7%, Thaba Chweu at 90,8% and Delmas at 90,9%

Finally, the municipalities that did not meet the provincial average in Limpopo were: Elias Motsoaledi at 49,0%, Makhusuduthamag at 61,7%, Fetakgomo at 63,1%, Greater Tubatse at 72,5%, Lepele-Nkumpi at 73,3%, Mookgopong at 76,4%, Aganang at 77,6%, Greater Marble Hall at 78,1%, Blouberg at 79,2% and Greater Giyani at 83,5%.

Figure 3.23: Percentage distribution of municipalities by level of achievement (comparison to national and provincial averages) - access to piped water by province, CS 2007

3.6.4 Performance of municipalities across provinces: Access to piped water within 200 metres

Figure 3.24 profiles the achievement of municipalities measured against national and provincial achievements. Looking at the provinces with more than ten municipalities which had proportions accessing piped water within 200 metres less than the provincial average, we notice that North West had 11 municipalities, KwaZulu-Natal had 39 municipalities, Northern Cape had 13 municipalities, Eastern Cape had 16 municipalities, and Western Cape had 11 municipalities as shown in Appendix 5.4.

Free State had the following municipalities below the provincial average: Letsemeng at 77,3%, Nketoana at 83,3%, Phumelela at 83,78%, Setsoto at 85,2%, Maluti a Phofung at 86,8%, Mangaung at 87,2%, Nala at 88,6% Kopanong at 89,2% and Tokologo at 89,5%.

In Gauteng the municipalities that did not meet the provincial average are: West Rand at 62,4%, Nokeng tsa Taemane at 74,0%, Kungwini at 77,0%, Westonaria at 83,3%, the City of Tshwane at 83,9%, Lesedi at 84,0%,

Mogale at 87,2%, Randfontien at 87,9% and Ekurhuleni Metro at 87,9%.

Mpumalanga had the following municipalities that did not meet the provincial average: Bushbuckridge at 38,6%, Dr JS Moroka at 57,0%, Nkomazi at 63,9%, Mkhondo at 67,4%, Seme at 69,7%, Albert Luthuli at 69,9%.

Finally, Limpopo had the following municipals that did not meet the provincial average: Fetakgomo at 29,2%, Makhuduthamag at 30,0%, Elias Motsoaledi at 34,6%, Blouberg at 40,9%, Mutele at 47,5%, Greater Giyani at 49,3%, Greater Tzaneen at 51,7%, Makhado at 53,6% and Aganang at 53,9%.

Figure 3.24: Percentage distribution of municipalities by level of achievement (comparison to national and provincial averages) - access to piped water within 200 metres by province, CS 2007

3.6.5 Summary

Across the provinces within South Africa, the proportion of households which had access to piped water was 88,6%. Western Cape and Free State had proportions above the national average. However, within the provinces, one finds more municipalities below the provincial average. Northern Cape had the least variation within the municipalities. Only four municipalities had proportions below the national average. The number of municipalities which had proportions below the national average by province are: Eastern Cape (20,0%), KwaZulu-Natal (42,0%), North West (7,0%), Gauteng (3,0%), Mpumalanga (4,0). and Limpopo (16,0%).

It was observed that it is not enough to have access to piped water. It needs to be within easy reach. The government policy is that piped water had to be within 200 metres in order to be easily accessed. When looking at the percentage of access to piped water within 200 metres across the provinces of South Africa, one finds that in Western Cape and Free State, all the municipalities had access to piped water within 200 metres, which was above the national average. Eastern Cape, on the other hand, had 16 municipalities that were below the national average. Within Eastern Cape however, one municipality (Mbizana) had the lowest percentage (2,6%).

Northern Cape had 3 municipalities that had proportions below the national average. Although Northern Cape had municipalities with percentages ranging between 70% and 90%, one municipality (Moshaweng) had a percentage of 41%. On the other hand, KwaZulu-Natal, who has 52 municipalities, of which 44 municipalities (85%) had percentages less than the national average. It can further be noted that in KwaZulu-Natal, the proportion of households that had access to piped water in the various municipalities ranged from 3% in Msinga to 88% in uMhlathuze. This clearly shows a large variation in access to piped water within acceptable distance.

North West had 12 municipalities that had proportions below the national average. Gauteng had 2 municipalities, Mpumalanga had 7 municipalities and Limpopo had 20 municipalities.

4. Conclusion

Municipalities play a pivotal role in the implementation of programmes aimed at improving the living standard of South Africans. Delivery of basic social services constitutes the cornerstone of this obligation. The results emanating from the analysis of the data collected in the Community Survey provide insights into the progress that has been made in this regard.

The above results indicate that substantial progress has been made since 2001, particularly the provision of piped water and electricity to the households. However, the percentage of households living in informal dwellings is still high in Free State, Gauteng and North West. The bucket system has almost been eradicated except in Free State
